Summary

Mission, Vision, and Values

In our first ever quarterly report we shared our mission, vision, and values statement to serve as a guiding light throughout our growth and development as an organization. We will continue to highlight these at the beginning of every report to keep our ultimate goals fresh in mind.

Our Mission

Decentralize the ownership structures of the world's marketplaces.

Our Vision

Deploy a platform for the creation and operation of communal marketplaces as decentralized entities, build network effects around the platform via a suite of ancillary services and by fostering a third-party developer ecosystem, and leverage these network effects to supplant privately controlled marketplaces with districts that allow for open participation in the governance of markets.

Our Values

1. **Transparency** - Open and honest communication provides each person the opportunity to contribute in the most meaningful way.
2. **Autonomy** - We supply the tools and information to do the job, but trust one another to get that job done.
3. **Inclusion** - We welcome participation from all colors and creeds, across all borders and nationalities. We are empowered by the diversity of our ideas because competition breeds strength.
4. **Decentralization** - We seek the path of broadest consensus, and work to align motivations through incentives, not instigation.

Product

This quarter, district0x focused on turning the ideas introduced in late 2025 into more concrete systems for development, onboarding, and product readiness. Across the network, work centered on making district infrastructure more accessible to outside builders, improving production quality across our active applications, and continuing to align product design with the emerging direction of AI-assisted development discussed in prior reports.

In parallel, ongoing community feedback around legacy products and the District Registry continued to inform broader ecosystem planning. Q1 saw progress not only within individual apps, but also in the underlying organizational and architectural work needed to support a more open, flexible, and developer-friendly district0x network.

District Registry

Building on Q4's community discussions around modernizing the District Registry, a more formal proposal was developed during Q1. The proposal explores a future in which developers can build districts using any technology stack while still integrating with district0x infrastructure through registry-based coordination, lowering the barrier to entry for new contributors and better reflecting current development practices.

As part of this direction, work continued around AI-assisted district development. Our proof-of-concept agent ARI was advanced to help developers understand district0x architecture and navigate the process of building on top of it, reflecting the vibe coding direction referenced in the previous quarter. Alongside that effort, a companion governance concept we called 'The Backroom' was proposed as a community-driven alternative to traditional token-weighted voting, where DNT holders stake around philosophical perspectives rather than individual proposals. This remains under discussion and pending further team review.

To support this broader objective, district0x development frameworks were further consolidated and organized during the quarter. Work included organizing d0x-lib and its shared libraries, archiving Farcaster Frames after its functionality was folded into StreamTide, consolidating district-graphql-utils and district-ui-component-form into the shared libraries, standardizing EIP-55 address validation across projects, and updating monorepo tooling for Clojars publishing. Together, these changes move the network closer to tech-stack agnostic district development, where registration with the District

Registry provides network integration while leaving implementation choices open to developers.

Streamtide

StreamTide activity in Q1 remained closely tied to creator acquisition and artist onboarding, with outreach continuing primarily through offline channels. This work built on Q4 partnerships and relationship-driven efforts, especially through open mic venues and direct networking, with the objective of steadily growing the pool of artists entering the ecosystem.

At the same time, StreamTides broader strategic role within district0x continued to evolve through its relationship with AquaPrime. Development and marketing activity around AquaPrime remained closely connected to StreamTides creator-facing vision, with lessons from game systems, asset distribution, and campaign design continuing to inform how district0x approaches user onboarding and participation flows.

Ethlance

During Q1, Ethlance received comparatively less visible feature emphasis as development resources were concentrated more heavily on StreamTide-adjacent infrastructure, AquaPrime and Insert Coin. However, the broader architectural and organizational improvements taking place across district0x contribute directly to Ethlances long-term positioning within a more modular and accessible network ecosystem.

As district0x continues modernizing shared tooling and refining the District Registry direction, Ethlance stands to benefit from the same push toward cleaner integration patterns, stronger infrastructure consistency, and easier third-party participation. These ecosystem-level improvements remain important groundwork for future iteration across the network's marketplace applications.

Aqua Prime

Q1 brought substantial technical progress for AquaPrime as development remained focused on preparing a strong MVP for initial release. A large portion of the quarter was dedicated to reviewing, cleaning, and rewriting major parts of the codebase from the ground up, with the goal of making the project more secure, maintainable, and

production-ready. This included addressing unsafe patterns and eliminating vulnerabilities such as exposed API keys, especially in areas where earlier rapid experimentation required a more rigorous implementation pass.

A major priority was the design of a cleaner and more scalable architecture with stronger separation between server-side and client-side logic. This work improves performance, establishes clearer coding standards across the project, and helps prevent users from tampering with sensitive game mechanics or gaining unfair advantages. These foundational improvements provide a more robust base for future development while moving the project closer to a reliable MVP release.

On the gameplay and contract side, Q1 also saw meaningful feature progress. The TraitRegistry contract was deployed to Base mainnet as a zero-admin autonomous system for breeding trait resolution, including NFT-gated uploads, MSTN burn mechanics, and community moderation through flagging thresholds. The breeding and hatching system advanced significantly as well, with comprehensive genetics implementation, on-chain egg minting, Pyth VRF integration for provable fairness, and incubation mechanics added to the game loop.

Narrative and world systems were extended through the introduction of TYOV, or Turn Your Own Vision, which adds player choice directives and memory sacrifice mechanics. Voice system updates streamlined room codes, enforced Privy-only registration, and resolved remaining voice flow issues, while world simulation work introduced NPC lifecycle systems, world event integration, and vault knowledge context for GM narration.

AquaPrime remains in closed alpha on Base mainnet, and community members continue to be invited to test the game and contribute feedback as development progresses.

Insert Coin

Insert Coin made substantial progress in Q1 and is now fully functional after extensive testing across its intended feature set.

One of the most important changes this quarter was the simplification of platform currency flows. ETH was removed as a wager type, and the platform now uses USDC and MATCH tokens, with USDC designated for competitive matches that count toward a player's overall record and MATCH functioning as a valueless token for casual matches that do not affect rank. Insert Coin, or INC, remains the planned official token for match

creation, joining, and tournament payouts once introduced.

The match system was significantly improved through Discord-native handling of match creation and easier lobby setup inside Arena Hub. Users can now join Discord-created matches on the frontend, both players stream embeds are displayed inside each players card column on the match detail page, and new leave match and dispute match actions were added. Refund summaries for disputed or cancelled matches now appear directly on match pages, while payout completion notifications help admins close matches and distribute payouts, with winner fees and platform fees sent instantly and player records updated automatically.

Player profiles and statistics also expanded in meaningful ways. A competitive leaderboard page with per-game rankings was added, per-game win and loss records with recent match history now appear inside player cards, top rival tracking was split between competitive and casual tiers by game, and profile pages were divided into separate competitive and casual tabs for clearer navigation.

Onboarding was another major area of improvement. Insert Coin now includes a browser-based wallet so users can create matches, receive payouts, and interact without already understanding traditional web3 wallet flows, though external wallets such as MetaMask, Rabby, and Phantom can still be used. Gasless transactions were also added, allowing players to make their first ten contract calls without holding ETH for gas, which reduces friction for new users and helps them learn the platform without an upfront paywall.

With core functionality stabilized, the next phase for Insert Coin shifts toward presentation, education, and launch preparation. Planned work includes improving the usability and organization of the Discord server, creating onboarding tutorial videos for YouTube and TikTok, expanding promotion through gaming communities and Discord server operators, and beginning to stream competitive one-on-one matches in anticipation of upcoming fighting game releases that could help drive visibility for the platform.

Marketing

In Q1, district0x marketing remained closely tied to product development, with the strongest emphasis placed on creator onboarding, community outreach, and positioning the network around developer accessibility. Building on the themes introduced in Q4, outreach continued around the future of the District Registry and the broader role of AI-assisted development inside district0x, while community feedback was actively gathered through Discord and social channels.

AquaPrime continued to function as a marketing arm for StreamTide, with progress on the game helping generate interest not only around gameplay but also around broader creator participation opportunities. Community members were invited to test the closed alpha, while artists interested in contributing artwork for cards or packs were encouraged to connect ahead of future VibeMarket-oriented campaigns. In parallel, StreamTide artist onboarding continued primarily through offline relationship-building and venue-based outreach, extending the creator acquisition efforts established in prior quarters.

Insert Coin marketing remained focused on launch readiness and audience development. Near-term priorities include tutorial content for YouTube and TikTok, outreach through established Discord communities, and live competitive match streams designed to build awareness around the platform as anticipated fighting game releases approach. Taken together, these efforts reflect a broader district0x strategy centered on practical onboarding, real user participation, and expanding network accessibility through both technical and community-facing initiatives.

Summary

Anticipating ongoing progress through the rest of 2026, our efforts will continue to build on the momentum of the work completed this quarter. We aim to further develop the tools, architecture, and applications that best reflect the needs of our community and the direction of the market, while continuing to improve accessibility for both users and developers across the district0x ecosystem.

We encourage everyone to stay connected through our platforms, participate in our discussions and follow along as we continue shipping new experiences across the network. We remain optimistic in the future of blockchain and will continue to build towards it.
